PT New nucleic acid encoding U4 haematopoietin receptor superfamily PT chain - potentially useful, e.g. for modulating cell proliferation PT or immune response, for treating cancer and auto:immune disease PS Claim 1; Pages 25-26; 38pp; English.

CC This is the nucleotide sequence encoding the murine U4 protein from CC the haematopoietin receptor superfamily used in the method of the CC invention for the modulation of cell proliferation, or the immune CC response. Transformed mammalian cells are used to produce recombinant CC U4 protein. The U4 protein is used to screen for specific binding CC agents, raise antibodies. It is also used as reagents for assays and CC in pharmaceutical compositions which may modulate cell proliferation, cC cell differentiation, and the immune system (e.g. for treating immune CC deficiency, inherited or the result of infection, autoimmune diseases, CC cancer, and allergy).

Claim 4; page 77-81; 182pp; English.

The haemopoletin receptor (HR) NR6.1 is a form of the novel HR NR6. Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 1629 BP; 336 A; 541 C; 453 G; 299 T;

Soluble Zcytor5 may be administered to down-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart enlargement. Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and therapeutically to modify Zcytor5 ligand effects.

Example 8; Page 99-100; 182ps; English.

CC NR6 is a novel haemopoletin receptor (HR). Interaction between the novel CC of a wide variety of cells. The HR and it's derivatives can be used for CC modulating the activity of the receptors e.g. to regulate development, CC maintenance or regeneration in an array of different cells and tissues in CC vitro and in vivo. They can be present in therapeutics used for CC modulating neuronal proliferation, differentiation and survival and curvival products can also be used for detection and diagnosis, e.g. for cancers CC or predisposition to cancers, or for drug screening.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a protein designated Zcytor5, which is a cytokinin-like receptor. Soluble Zcytor5 may be administered to Cdown-regulate the effects of a growth and/or maintenance factor in thyroid, heart, and skeletal muscle for example to lessen the effect of cardiotrophin-1 on cardiac pathologies, so preventing heart cenlargement. Zcytor5 could be used to detect cardiotrophin-1 in the Comparising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the Tanti-idiotypic antibody could be used to purify Zcytor5 and the Taylor antibody could be used to purify Zcytor5 and the Taylor antibody could be used to gene on chromosome 19. Antibodies and the Canti-idiotypic antibody could be used to purify Zcytor5 and the Taylor antibody could be used to purify Zcytor5 and the Taylor antibody Scytor5 ligand effects.

The present sequence encodes an allelic varaint of protein design present sequence encodes an allelic varaint of protein design courts. Which is a cytokinin-like receptor. Soluble Zcytor5 maj administered to down-regulate the effects of a growth and/or maj factor in thyroid, heart, and skeletal muscle for example to less effect of cardiotrophin-1 on cardiac pathologies, so preventing enlargement. Zcytor5 could be used to detect cardiotrophin-1 in blood, and to discover other possible Zcytor5 ligands. A probe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
Proceeding U4 haematopoietin receptor superfamily procedure and uncleic acid encoding U4 haematopoietin receptor superfamily procedure and uncleic acid encoding useful, e.g. for modulating cell proliferation. The process of the reating cancer and auto:immune disease procedure in Page 28; 38pp; English.

Convention for the nucleotide sequence encoding the human U4 protein from the haematopoietin receptor superfamily, used in the method of the convention for the modulation of cell proliferation, or the immune convention for the U4 protein is used to screen for specific binding convention. The U4 protein is used to screen for specific binding conventions, raise antibodies. It is also used as reagents for assays and convention of isolation of cognate ligands and receptors, and convention is used in pharmaceutical compositions which may modulate cell proliferation, conventions, inherited or the result of infection, autoimmune diseases, concer, and allergy).

Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 1391 BP; 281 A; 459 C; 417 G; 234 T;

NR6 is a novel Haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 834 BP; 167 A; 274 C; 225 G; 168 T;

NR6 is a novel haemopoletin receptor (HR). Interaction between the novel haemopoletin receptor (HR). Interaction between the novel haemopoletin receptor (HR). Interaction between the novel had a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, witro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.

PNew isolated haemopoletin receptor - used for developing products for modulating projiferation, differentiation and survival of cells.

PT for modulating projiferation, differentiation and survival of cells, pr e.g. neuronal cells

PT e.g. neuronal cells

Claim 6; Page 90-92; 182pp; English.

CC interaction between the novel HR and a ligand facilitates proliferation, claim 6; Construction between the novel HR and a ligand facilitates proliferation, claim for modulating the activity of the receptors e.g. claim for certain and survival of a wide variety of cells. The HR and it's claim for contact cells and tissues in vitro and in vivo. They can be present in claim for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, ce.g. for cancers or predisposition to cancers, or for drug screening.

The NR6 protein is a novel Haemopoletin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening. Sequence 11832 BP; 2447 A; 3367 C; 3298 G; 2720 T;

                   New isolated haemopoietin receptor - used for developing products for modulating proliferation, differentiation and survival of cells, e.g. neuronal cells
claim 8: page 108:114; 182pp; English.
That NRG gene encodes a novel Haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's products can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for feetering and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            6570

Zcytor5 could be used to detect cardiotrophin-1 in the blood, and to discover other possible Zcytor5 ligands. A probe comprising Zcytor5 DNA or RNA can be used to determine the presence and integrity of the Zcytor5 gene on chromosome 19. Antibodies and the anti-idiotypic antibody could be used to purify Zcytor5 and therapeutically to modify Zcytor5 ligand effects.
